

CONNECT visualization

Visualize industrial data in the cloud using self-service and pre-defined dashboards

CONNECT visualization simplifies the way you visualize operations, engineering and other industrial business information together. It provides diverse groups of data to users in your organization with two composable dashboard types—self-service and predefined—based in the cloud.

Using preconfigured and custom content, users can create displays that meet multiple use case and role-based information needs. Sophisticated visualization capabilities enable remote and virtual corporate teams with easy access to data from the field, speed up reporting time, reveal new insights, and establish a feedback loop on a common digital thread.

Operations, engineering and business data

Data is provisioned from CONNECT data services, applications and third-party sources to populate dashboards with charts, graphics, and other visual information.

Craft as many dashboards as you need

Users can create dashboards for many different use cases and data visualization needs. They can assemble them for specific role-based needs and bring a unique flexibility for surfacing industrial information.

Organize and share

Build lists of assets and previously associated content for easy sharing with other users. Organize content and manage user permissions by visualization type and individual dashboard.

Strategic analysis for remote and virtual teams

Digitally connect operations analysis teams for improved knowledge-sharing and information access. Correlate KPIs between teams and operations units to improve real-time agility and decision support.

Industrial AI Assistant

Generative AI tool helps users quickly find and summarize information by asking a digital intellect queries through a chat interface.

Two dashboard types for content visualization

Self-service dashboards allow users to customize their dashboards from an included content library, so users have the flexibility to address unique data visualization needs and root cause investigation.

Predefined dashboards are engineered views, providing a more structured and interactive visualization experience focused on tracking an understood perspective with a consistent visualization.

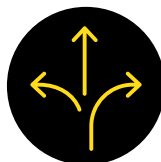

Bring together data sources and data types from across your organization

Breakdown information silos and empower remote teams

Contain and normalize the scale and complexity of your data

Move from reactive mitigation to proactive assessment

Increase information awareness across groups

Benefit from the power of collective intelligence
